Senior Friendly Hospital Provincial Strategy

PHASE 1

PHASE 2

PHASE 3 - ONGOING

Objective

- Identify current state

Plan

- Hospital self-Assessment
- LHIN-level roll-up
- Provincial roll-up

Objective

- Close the gap

Plan

- Implement hospital improvement plans
- Develop key enablers

Objective

- Monitor and sustain hospital and system improvements

Future State

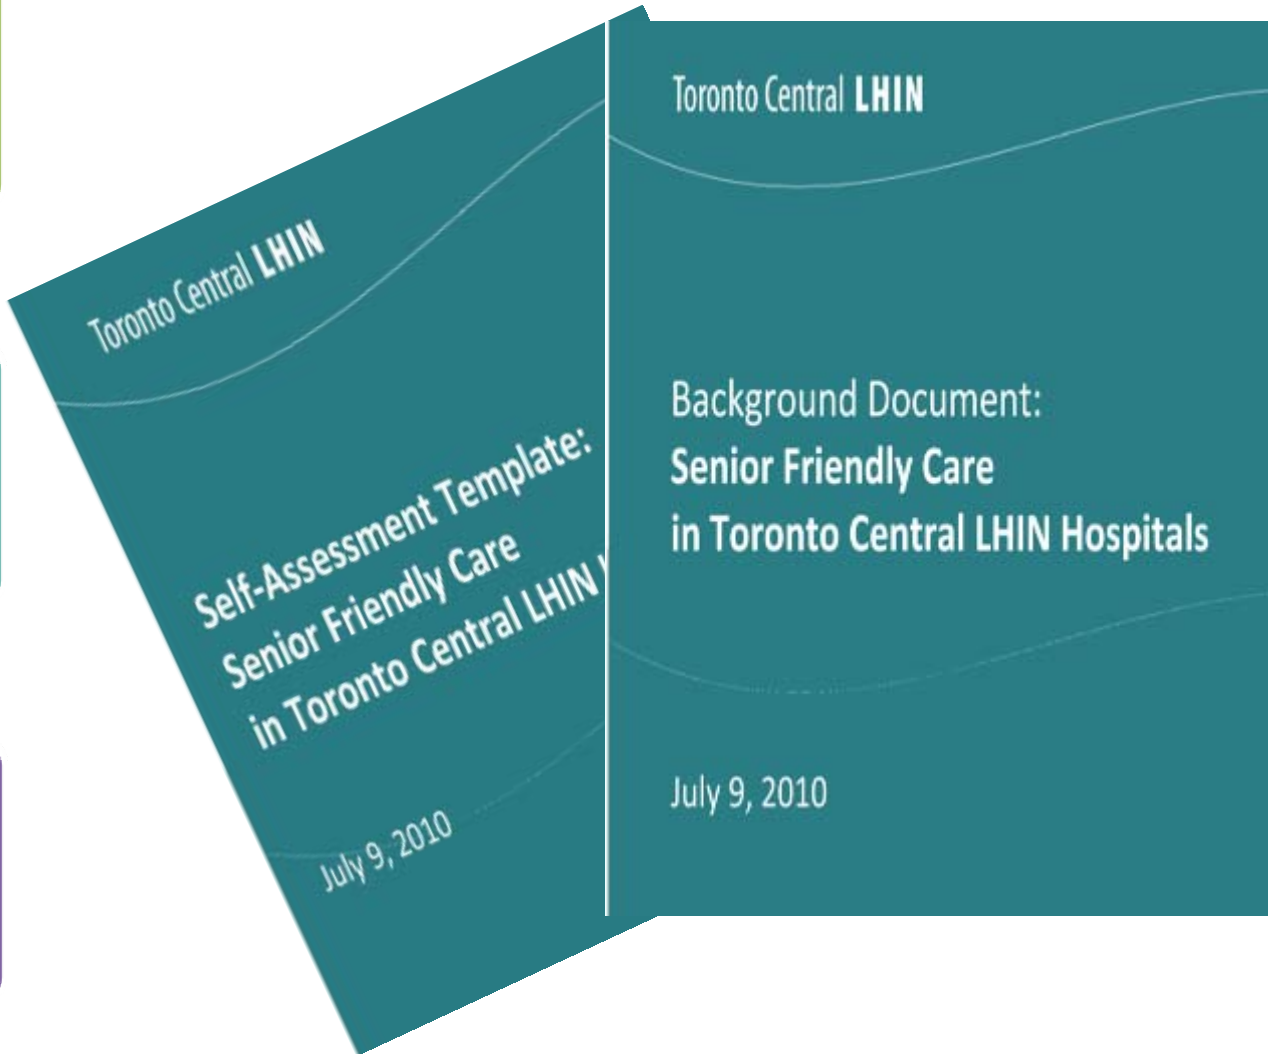

- Prevent functional decline
- Improve patient experience
- Enable hospital staff
- Improve equity

Senior Friendly Hospital Care in the TC LHIN

Senior Friendly Hospital Care in Ontario

- Senior Friendly Hospital self-assessments completed by 155 hospitals in Ontario
- 6 RGPs of Ontario worked with 13 LHINs to generate regional SFH summary reports
- Coordination by TCLHIN and RGP of Toronto

Provincial Summary Report

- **Describes existing state of SFH care in Ontario**
- **Identifies promising practices**
- **Recommends priority areas for action**

RGP

Organizational Support

- **Hospital Leadership**
 - 56% of hospitals designated a senior executive to lead SFH
 - 39% had SFH goals in strategic plan
 - 30% had explicit commitment at level of board of directors
- **Supporting Human Resources Development**
 - 55% had geriatrics content in orientation or education for staff
 - ☆ frailty focused education to all staff
 - ☆ developing geriatrics champions
 - ☆ HR policies that encourage skills development in geriatrics
- **Service Planning Structures**
 - ☆ solicit input from community and health system partners

Processes of Care

Clinical Protocols/Monitoring

- most common – falls, pressure ulcers, restraint use, pain management
- least common – management of behaviours, sleep, functional decline, hydration/nutrition
- functional decline an emerging priority

Interprofessional Practice in the Hospital

- ☆ geriatric assessment teams, leveraging volunteers

Inter-organizational Collaboration for Transitions in Care

- ☆ post D/C follow-up care
- ☆ partnerships for transitional care

Emotional and Behavioural Environment

Patient-Centred Care Designed with Seniors in Mind

- 28% of hospitals - age-specific measures in satisfaction or quality improvement initiatives

- ★ Staff for way-finding, personal menu assistance

Supporting Communication and Patient Involvement in Care

- ★ hearing amplifiers, translation services

- ★ team rounds at the bedside

- ★ Early goal setting discussions

- ★ discharge planning information packages

Ethics in Clinical Care and Research

Access to a Clinical Ethicist for Complex Situations

- 83% of hospitals have access to a bioethicist
- ☆ regular learning opportunities (case studies, lunch and learns)

Procedures for Capacity and Consent Issues

- ☆ internal processes involving appropriate clinical staff
- ☆ consultation with external bodies

Procedures for Advance Directives

- 78% of hospitals have formal policies/procedures, but many are limited in scope to resuscitation orders
- ☆ resources provided to patients, families and care team to guide advance care directives

Physical Environment

- 34% of hospitals have performed SFH audits to prioritize improvements to physical spaces
- overall reliance on AODA and building code standards in physical planning
- ★ involvement of clinical staff and older adults in physical environment planning to inform design team

Provincial SFH Action Priorities

■ **Functional Decline**

- Implement interprofessional early mobilization protocols across hospital departments to optimize physical function

■ **Delirium**

- Implement interprofessional delirium screening, prevention, and management protocols across hospital departments to optimize cognitive function

■ **Transitions In Care**

- Implement practices and developing partnerships that promote interorganizational collaboration with community and post-acute services

PRIORITY #1 – FUNCTIONAL DECLINE
<p>SCREEN</p> <p>Screening of older patients early in admission for risk of functional decline</p>
<p>MANAGE</p> <p>Implementation of evidence-based protocol adapted for local context</p> <p>(see Appendix A for examples of implemented practices)</p>
<p>MONITOR/EVALUATE</p> <p>Comply with hospital indicators defined by Ontario Senior Friendly Hospital Strategy</p> <p>Regular review and reporting to quality and safety committees</p>

Senior Friendly Hospital Framework Recommendations – Activities to Support Priority Area	
Organizational Support	
(1) Board of Director Commitment	<ul style="list-style-type: none"> Senior executive lead reports to board Senior executive leads working group responsible for implementing mobility program
(2) Senior Executive Lead	<ul style="list-style-type: none"> Representation on quality and safety committee
(3) Geriatrics Champions	<ul style="list-style-type: none"> Serve as peer-to-peer resource and coach in support of mobility protocols Reinforce formal knowledge-to-practice activities
(4) HR Development	<ul style="list-style-type: none"> Formal education on mobility protocols
Emotional & Behavioural Environment	
(7) Seniors Sensitivity Training	<ul style="list-style-type: none"> Orientation and refresher sensitivity training for all staff, clinical and non-clinical, on aging, person-focused care, and cultural competency integrated with performance appraisal processes
(8) Senior Friendly Person-Centred and Diversity Practices	
Ethics in Clinical Care and Research	
(9) Ethicist Services Available	<ul style="list-style-type: none"> Ensure the availability of ethicist or ethics committee to assist clinical teams, patients, and families in complex decision making
(10) Policies for Autonomy and Consent/Capacity	
Physical Environment	
(11) Senior Friendly Design Resources Used in Addition to Accessibility	<ul style="list-style-type: none"> Review ward set up to allow for mobilization Implement environmental changes to reduce risk of falls

Senior Friendly Hospital Provincial Strategy

Slider Description Text Lorem Ipsum

Welcome to The Senior Friendly Hospital Toolkit

Seniors account for 63% of acute inpatient days and 43% of provincial health expenditures in Ontario. Hospitalization can be a pivotal event in a frail senior's life. It can add years and quality to life, or create complications that result in a difficult-to-reverse decline in physical or cognitive function. Without senior friendly processes in place, seniors may also have higher rates of adverse events, surgical complications, and nosocomial infections. Poor outcomes can result, such as increased length of stay, re-admission to hospital, and decreased capacity for independent living. [Read More](#)

DELIRIUM SCREENING AND DETECTION

The Confusion Assessment Method (CAM)

OVERVIEW:

The Confusion Assessment Method (CAM) was originally developed in 1988-19 of delirium. The CAM is consistent with the DSM-IV criteria for delirium. It was applications to provide a standardized method for non-psychiatrically trained h and accurately.

AUTHORS/PRIMARY REFERENCE:

Inouye SK, CH vanDyck, CA Alessi, S Balkin, AP Siegal, and RI Horwitz (1990). CI Method. A new method for detection of delirium. *Annals of Internal Medicine*

STRUCTURE OF THE TOOL:

The most basic form of the CAM comprises four items, each reflecting a cardin

- 1) Acute onset
- 2) Inattention
- 3) Disorganized thinking
- 4) Altered level of consciousness

A positive finding for delirium requires the presence of items 1 and 2, and eith

PSYCHOMETRIC PROPERTIES:

- Sensitivity – 74-93% (95% confidence interval)⁴
- Specificity – 87-96% (95% confidence interval)⁴
- Inter-Rater Reliability – $\kappa=1.00$ (for presence/absence of delirium), $\kappa=0.93$ (

TARGET POPULATION AND SETTING:

- Confused older people in hospital
- Inpatient Acute Units
- Emergency Departments

INTENDED USER(S):

- Medical, nursing staff, and other clinicians – training is recommended for o
- An instruction manual is available on-line (see below in “Where to get the C

NOTES ON USING THE CAM:

- Administration of the CAM takes 5-10 minutes
- It is recommended that the CAM be combined with formal cognitive assessi test
- The CAM has been translated into Chinese, Dutch, Finnish, French, German,

Preventing and Managing Delirium

1. The evidence in the prevention of delirium favours multi-dime component interventions (see below). This is ideally suited to important to recognize that optimizing non-clinical hospital op processes can play a key role in an organization-wide deliriu

Examples of Interventions within Evidence-Informed Preven

OS ORGANIZATIONAL SUPPORT STRATEGIES

- Provide staff with education on delirium
- Allocate adequate staff
- Develop policies and guidelines over harmful procedures (e.g. indwelling catheters)

PC PROCESSES OF CARE STRATEGIES

- Routinely screen for delirium and changes in cognitive functio
- Encourage or provide assistance with eating and drinking to e proper positioning, nutrition supplements as needed
- Provide regular bowel routines to avoid constipation
- Minimize use of indwelling catheters
- Provide oxygen therapy and chest physiotherapy as needed

Where applicable, the evidence from the literature is organized by SFH Framework domain tabs, reinforcing organization-wide approaches

Provincial SFH Action Priorities

■ **Functional Decline**

- Implement interprofessional early mobilization protocols across hospital departments to optimize physical function

■ **Delirium**

- Implement interprofessional delirium screening, prevention, and management protocols across hospital departments to optimize cognitive function

■ **Transitions In Care**

- Implement practices and developing partnerships that promote interorganizational collaboration with community and post-acute services

Knowledge-to-Action Cycle

Complications of Immobility

THE DANGERS OF GOING TO BED

BY

R. A. J. ASHER, M.D., M.R.C.P.

“...rest in bed is anatomically, physiologically and psychologically unsound. Look at a patient lying long in bed. What a pathetic picture he makes!

The blood clotting in his veins, the lime draining from his bones, the scybala stacking up in his colon, the flesh rotting from his seat, the urine leaking from his distended bladder and the spirit evaporating from his soul.”

Selected RCT evidence for early mobilization

Surgical Dx	Many RCTs
Pneumonia	↓ LOS 5.8 vs. 6.9 days (Mundy Chest 2003;124:883-889)
Stroke	↑ Barthel Index at 3 months Earlier return to walking 3.5 vs. 7 days P=0.03 (Cumming TB Stroke 2011; 42 :153)
Cochrane Review (2009)	↑ Discharge to home, NNT=16 ↓ LOS by 1.08 days (-1.93 to -0.22)

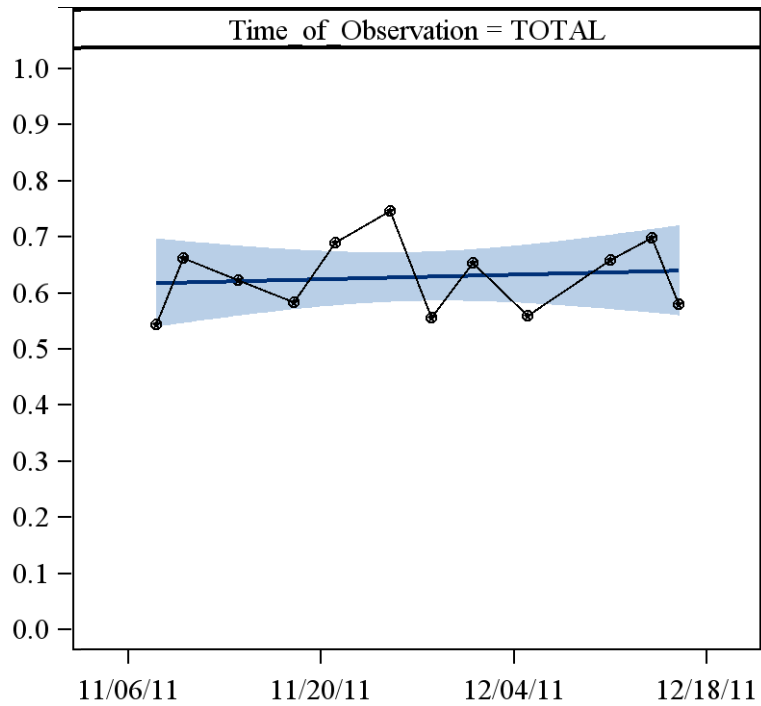

- 83% of measured hospital stay spent in bed
- Median time spent standing or walking = 43 minutes or 3% of day

Brown, C et al JAGS 2009;57:1660

Baseline Data

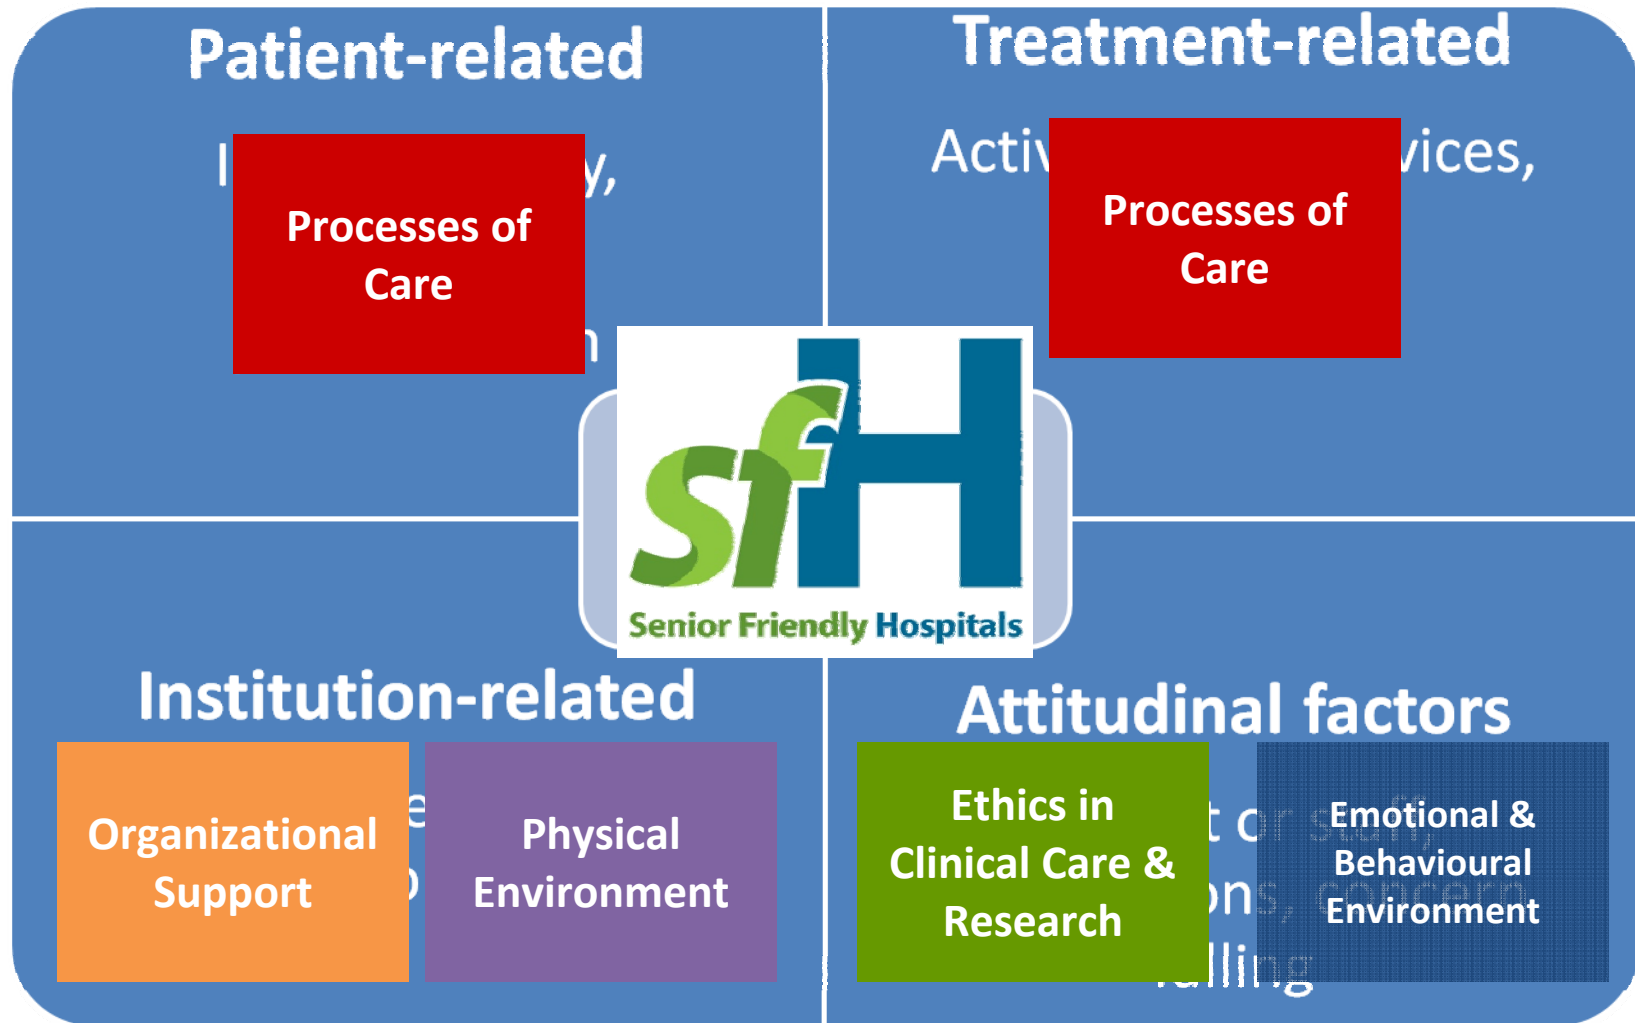

% in bed unit 1

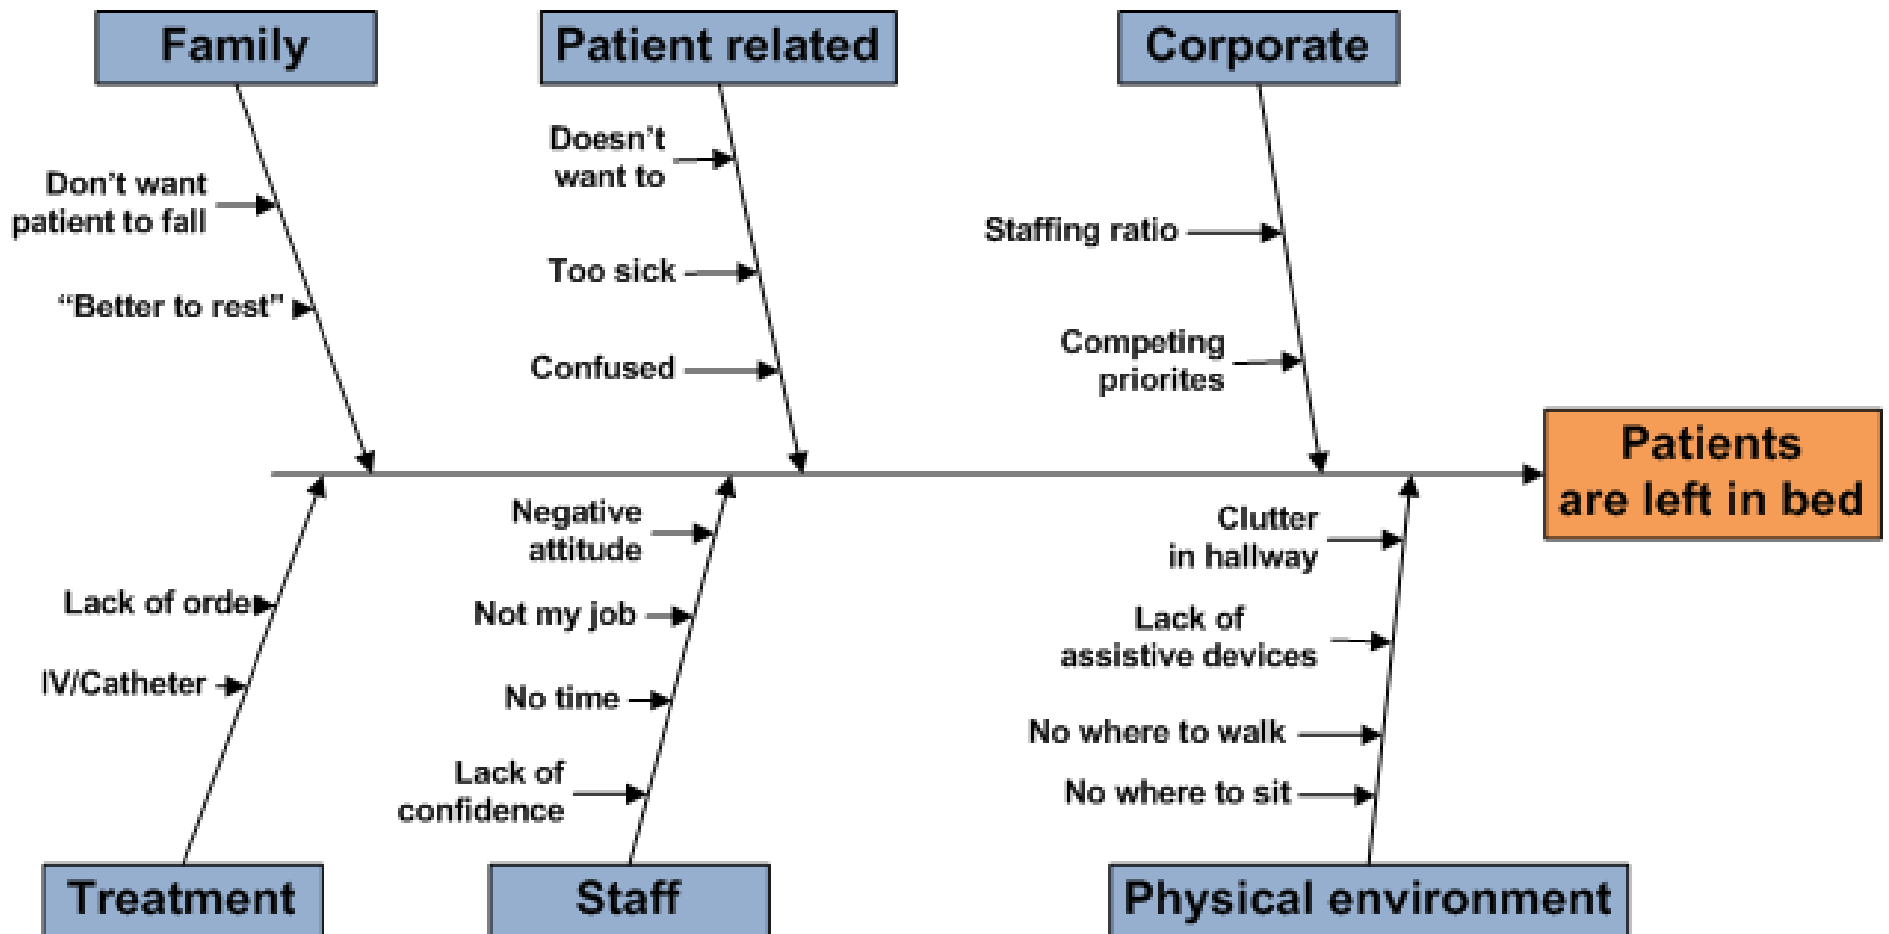

% in bed Unit 2

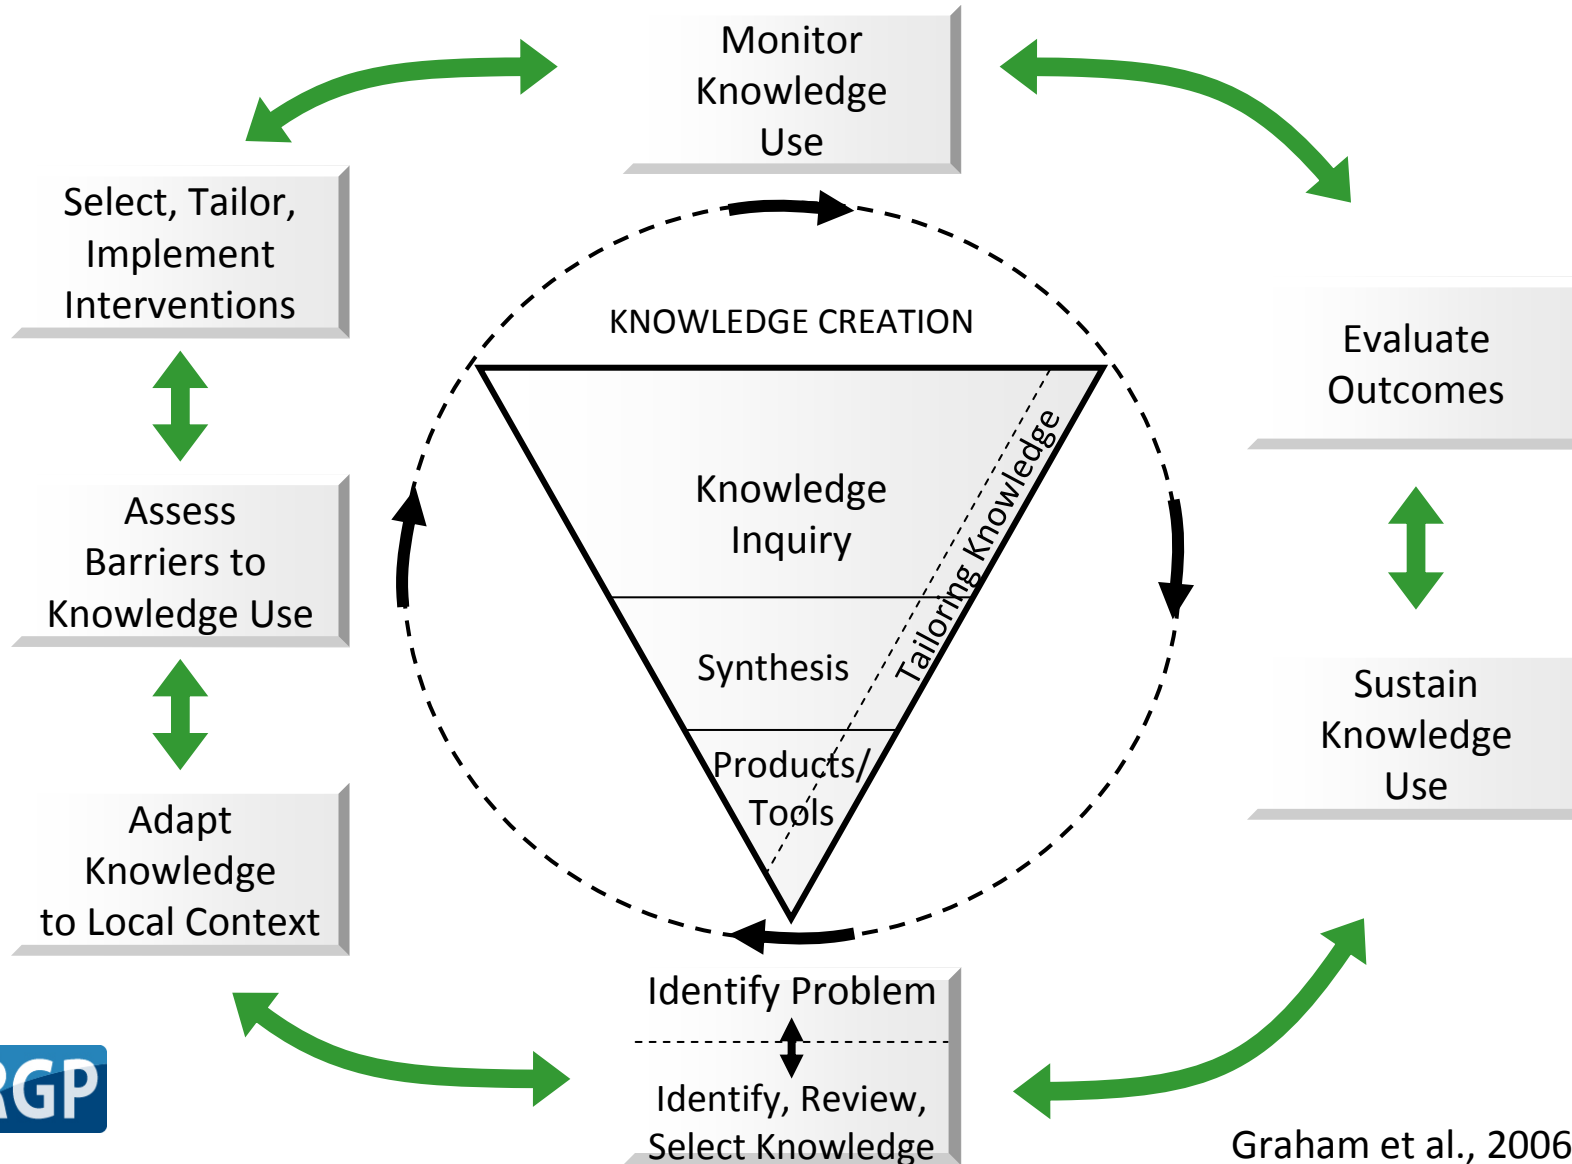

Fishbone diagram

Knowledge-to-Action Cycle

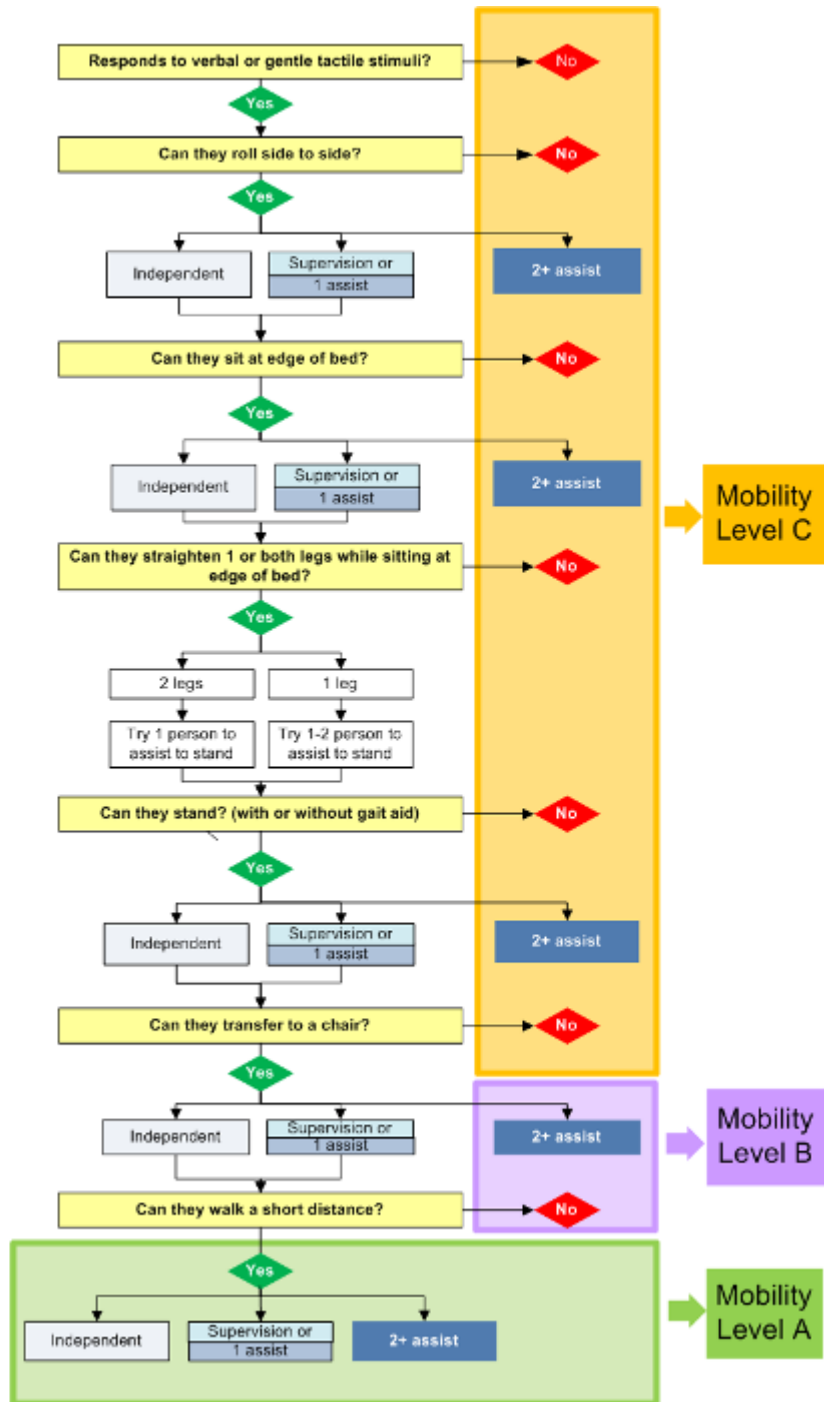

Goals of MOVE ON

- Mobility assessment within 24 hours of the decision to admit and reassessment daily
- At least three times a day, progressive, scaled mobilization

Mobility Assessment Algorithm

- Environment Check:**
- Chair/wheelchair is set-up beside the bed on patient's stronger side (as applicable)
 - Chair is against a firm surface
 - Brakes are on the bed and the chair (if applicable)
 - Lines and tubes are positioned properly
- Patient position/set-up:**
- Patient is seated at the edge of the bed with 1/3 of patient's thigh on bed surface
 - Bed height is high enough that patient's hips are just above their knees with feet on the floor
 - Patient's feet are hip width apart and are behind their knees
 - Patient is wearing appropriate footwear to prevent slipping
 - Appropriate gait aid available (if necessary)
 - Consider OT referral for cognitive, visual, perceptual and impaired ADL issues affecting mobility
- Transfer to Chair:**
- Have a *firm* hold on the patient – hands around patient's buttock, hips, or holding their hand
 - Avoid pulling up through patient's shoulder
 - Block patient's weaker leg (if applicable) while transferring to chair to avoid knee giving out

Simplified Mobility Assessment Algorithm

1. Can they respond to verbal stimuli?
2. Can they roll side to side?
3. Can they sit at edge of bed?
4. Can they straighten one or both legs?
5. Can they stand?
6. Can they transfer to a chair?
7. Can they walk a short distance?

Mobility Level

C

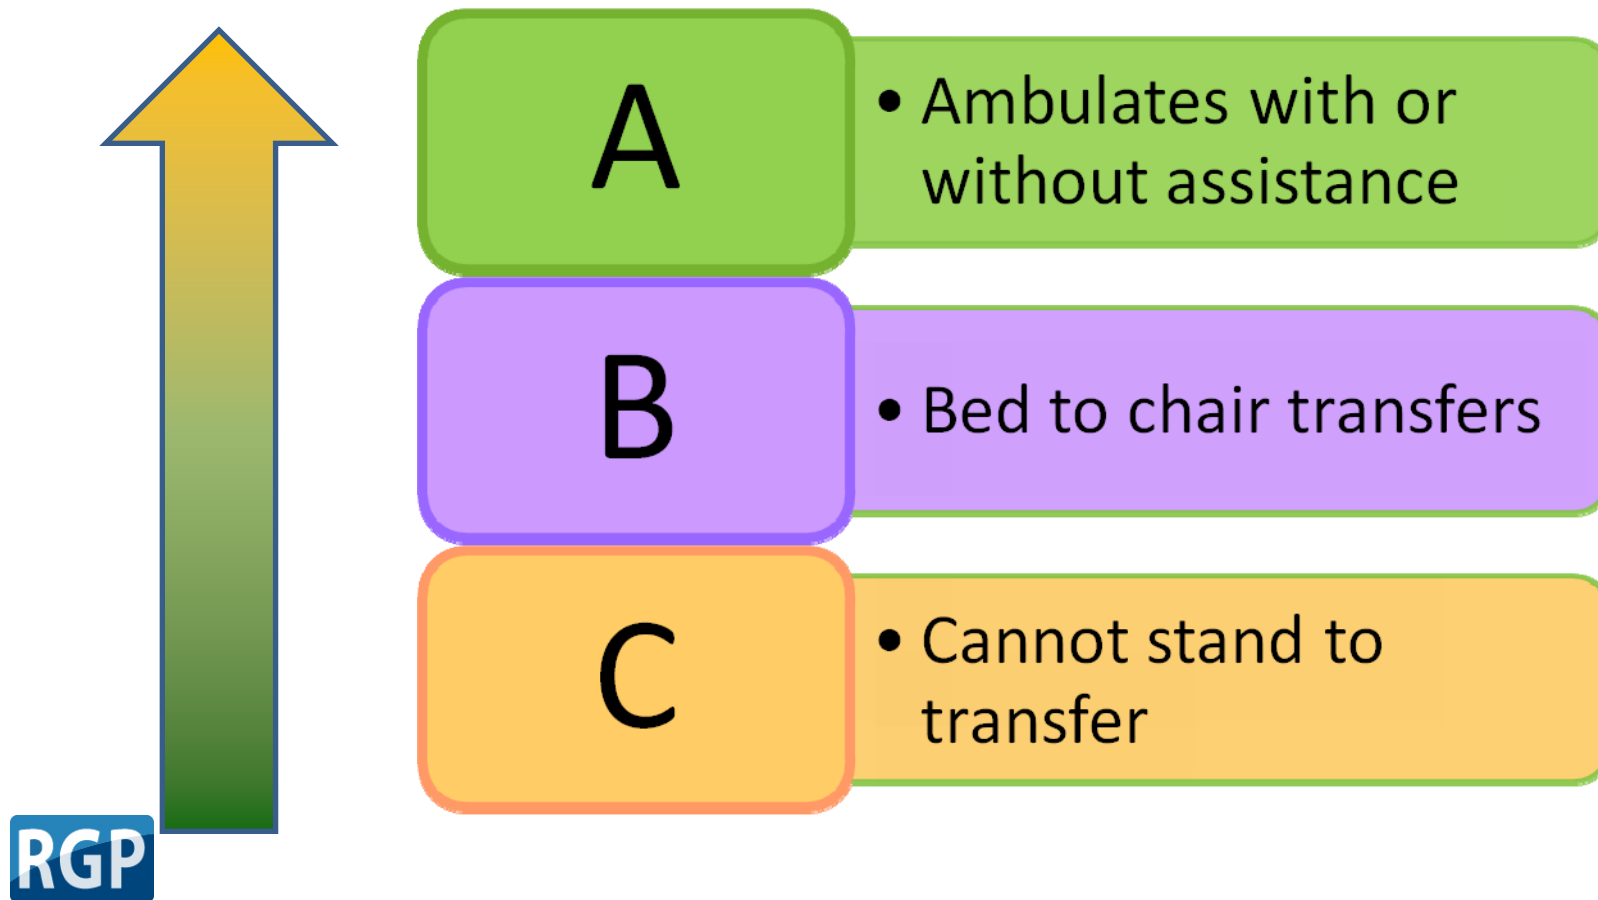

B

A

Develop an individualized mobility care plan

A Review of the ABC's of Mobility

Mobility Assessment Algorithm

1. Can they respond to verbal stimuli?
2. Can they roll onto to side?
3. Can they sit at edge of bed?
4. Can they straighten one or both legs?
5. Can they stand?
6. Can they transfer to a chair?
7. Can they walk a short distance?

Mobility level (A-A2)	Staff Role	Volunteer Role
A1 Independent Ambulation	Amalgamate 3x/day or more	Amalgamate with patient
A2 Ambulate with Assist	Amalgamate 3x/day or more with assist/get aid if appropriate	Simple Exercises
B Transfer Bed to Chair	Transfer up to chair 1x/day Up to commode chair Active ROM	Simple Exercises
C Complete Bed	Encourage to participate in care Upright for meals Active/Passive ROM 3x/day Assist with turns Lower to chair, tub/shower	Simple Exercises

KEEP MOVING

Myths & Facts about Being Active in the Hospital

- Daily assessment of mobility status
- Mobilize three times daily
- Incorporates interprofessional teamwork and attitude awareness training
- Multipronged tailored education

Hazard

Decline in mobility for onset of complications
Pathophysiological changes within 24 hours

A Message for Patients and Families

Benefits of getting out of bed while in hospital

Skin <ul style="list-style-type: none"> Getting out of bed can help prevent bed sores 	Lungs <ul style="list-style-type: none"> Improved breathing Prevents pneumonia Improved ability to fight infections 	Nutrition <ul style="list-style-type: none"> Improved appetite Less risk of choking when eating
Brain <ul style="list-style-type: none"> Improved mood Improved sleep 	Muscles/Bones <ul style="list-style-type: none"> Less weakness Prevents loss of strength Less pain in joints 	Heart <ul style="list-style-type: none"> More stable blood pressure Improved circulation
